# 1. Introduction of Module

## 1.1 Introduction

GM75 Bar code reader module is a high performance scanner, can read 1D bar code easily and read 2D bar code with high speed. It also wins high scan speed for linear code, even for bar code on paper or screen.

GM75 bar code reader module is an advanced bar code decoding algorithm which developed on image recognition algorithm, can easily and accurately read bar code, simplify secondary development.

GM75 works stable in dark and large temperature range.

The GM75 has the following features:

- (1) High-precision small code reading (1D: 3mil, 2D: 5mil)
- (2) high speed reading
- (3) High-contrast reading ( $\geq 15\%$ )
- (4) High motion tolerance performance

## 1.2 Technical Specification

Parameter	Performance	
Sensor	CMOS	
Scan Mode	640*480	
Lighting	White Light (3000K)	
Collimation	Green Light (527nm)	
Read Code Type	2D	QR Code, Data Matrix, PDF417, Micro PDF417, Micro QR, Aztec, etc
	1D	EAN-13, EAN-8, UPC-A, UPC-EM ISSN, ISBN, CodaBar, Code 128, Code93, ITF-14, ITF-6, Interleaved 2 of 5, Industrial 2 of 5, Matrix 2 of 5, GS1 Databar(RSS), Code 39, Code 11, MSI-Plessey, etc
Accuracy of reading*	1D: 3MIL (Code39, CODE128, EAN13) ,2D: 5MIL (QR, DM, PDF417)	
Viewing Angle	Horizontal 42°, Vertical 32°	
Contrast*	≥15%	
Depth of Field*	QR (15mil)	30~220mm
	QR Payment Code (Mobile)	80~550mm
	Data Matrix (10mil)	30-140mm
	PDF 417 (6.7mil)	50-120mm
	EAN-13 (13mil)	50~280mm
	Code 39 (8mil)	30-190mm
	Code 128 (15mil)	80~320mm
Bar code sensitivity **	Pitch	±60°
	Tilt	360°
	Skew	±60°

\* Test conditions: environment temperature =23℃; environment illumination =300 LUX;

\*\* Test conditions: Test distance = (minimum depth of field + maximum depth of field) /2; environment temperature =23℃; environment illumination =300 LUX;

Default scan mode		Continuous Mode	
Read code time for once		3s	Parameter: 0.1-25.5s; step-size: 0.1s; 0 means no time limited
Reading interval		1S	Parameter: 0.1-25.5s; step-size: 0.1s; 0 means no time limited
Output		GBK	GBK UNICODE BIG5
Interface		USB	USB UART USB VCom
Interface (TTL-232)	Serial Baud Rate	9600	Adjustable, details at 2.1
	Verification	N	
	Data bit	8	
	Stop bit	1	
	CTSRTS	No	
serial mode	Read code time for once	5s	Parameter: 0.1-25.5s; step-size: 0.1s; 0 means no time limited

#### Mechanical/electrical Parameters:

Parameter	Performance
Interface	TTL-232、USB
Size(mm)	53(W)×49(D)×23.7(H)
Weight	31.3 g
Prompting mode	Buzzer LED
Operating Voltage	5V
Current	Operating Current 250mA(Max)
Rated power consumption	≤850mW(Max)
Standby Current	≤20mA(Typical)
Startup time	≤250mS (Typical)

#### Environmental Parameters:

Parameter	Performance
Operating temperature	-20℃~60℃
Storage Temperature	-40℃~+70℃
Operating Humidity	5%~95% (Non-Condensing)
Environmental Light	Normal indoor light source
Working vibration	10-150HZ, 0.5G, 3 axial direction, 1min/oct, 1 time/axial direction
Durable vibration	10-150HZ, 2G, 3 axial direction, 1min/oct, 20 times/axial direction
Fall	Withstand 1.2 m drop on concrete floor (50 times 1.2 m drop on concrete floor repeatedly)

Default read configuration:

Type	Name	Support	Default Read
2D	QR Code	✓	✓
	Micro QR	✓	×
	Data Matrix	✓	✓
	PDF417	✓	✓
	Micro PDF417	✓	×

	GS1 Databar(RSS)	✓	×
	Code 39	✓	✓
Code 11	✓	×	
MSI-Plessey	✓	×	

## 1.4 Scan Area

Testing in office (250 lux)

## 1.5 The Position of Read Code

When use the scanner to read 1D and 2D code, don't need to pitch,tilt,skew too much. The scanner in the following areas will make barcode collection easier.

### Tilt:

If all bar codes are not in the readout beam, the module will not be able to read the bar code. But if the bar code is in the reading area, the rotation angle can reach  $360^{\circ}$  .

### Pitch:

The module can read the bar code at an angle of up to  $65^{\circ}$ , but it is recommended to reduce the angle of tilt to improve the reading efficiency.

### Skew:

Skew reduces the bar code height. A pitch Angle of  $2^{\circ}$  to  $3^{\circ}$  is optimal because it prevents direct reflection of the bar code. The module can read the bar code deflection Angle up to  $65^{\circ}$ , but it is recommended to shorten the spacing to improve the reading efficiency.

## 1.6 Circuit Board Communication Interface

Circuit board diagram:

**UART Communication interface definition:**

Pin	Name	Definition	Description
1	5V	Power Input	Power input 5V
2	TX	Out	Data output. TTL logical level
3	RX	In	Data input. TTL logical level
4	GND	-	Signal ground

**USB Communication interface definition:**

Pin	Name	Definition	Description
1	5V	Power Input	Power input 5V
2	D+	Out	USB data output
3	D-	In	USB data input
4	GND	-	Signal ground

## 1.7 Setup Code

Customer can set module by scan setup code.

**Default: setup code on**

**Off**

Output details in setup code

**Default: Not output**

**Output**

## 1.8 Save and Cancel

Scan cancel code to cancel wrong read date.

**Save**

**Cancel last byte**

**Cancel all read bytes**

**Cancel changes**

## 1.9 Reset

Back to Factory Setting by scan follow code.

**Reset**

## 2 Communication interface

GM75 can receive database, control module and set functional parameter by TTL - 232.

### 2.1 Serial Communication Interface

It's default and common to connect module and mainframe(such as PC, POS) by serial communication interface. Make sure communication parameter for module and mainframe are same, then it will communicate smooth and correctly.

**Serial Output**

TTL-232 is used for serial interface which suitable for most system. Required change-over circuit for RS-232.

Default Parameter as formForm 2- 1. Only Baud Rate can be changed.

Form 2-1 Default Parameters

Parameters	Default
Serial communication interface	Standard TTL-232
Baud rate	9600
Verification	N
Data bit	8
Stop bit	1
CTSRTS	N

#### Baud Rate Settlement

**1200bps**

**4800bps**

**9600bps(Default)**

**14400bps**

**19200bps**

38400bps

57600bps

115200bps

### 2.1.1 Serial Port Check Bit Configuration

Modify the parity bit of the serial port by scanning the following configuration code.

\*NONE

ODD

EVEN

### 2.1.2 Serial Port Calibration

Customers can periodically send heartbeat packets to ensure the data accuracy. The format is as follows:

Heartbeat packets from main control	Return command
7E 00 0A 01 00 00 00 30 1A	03 00 00 01 00 33 31

Note: It is recommended to send a heartbeat packet every 10 seconds. If no correct reply is received for three consecutive times, the main control should be handle it accordingly.

## 2.2 USB HID Interface

Scan the following code to become HID device when module connects PC by USB.

**\*USB HID device**

### 2.2.1 HID Type Device Selection

When the device is a HID type device, it can be 2 different types of devices.

**\*HIDKBW**

**HIDPOS**

### 2.2.2 HID Parameter Configuration

Scan the following code to modify the PC access cycle for HID devices.

**\*1ms**

**3ms**

**5ms**

**10ms**

Modify the interval between the device from a valid message to a released message by scanning the following setup code.

**\*0ms**

**1ms**

**5ms**

**10ms**

**15ms**

Modify the interval between the device from releasing message to the next valid message by scanning the following setup code.

**\*0ms**

**1ms**

**5ms**

**10ms**

**15ms**

Modify the state of the CapsLock when it prints by scanning the following setup code.

**\*Off**

**On**

### 2.2.3 HID Lead Key Output

By scanning the following setup code to make HID output a leading message before each segment of data, so as to facilitate customer software development and positioning. The key value is ctrl+shift+r.

\*HID leading Forbid

Allow

## 2.3 USB HID-KBW

### 2.3.1 HID-KBW Device Mode

If the device is an HID device (if it is not an HID device, pls read the configuration code of the HID device first),you can read the following configuration code and select HID-KBW device mode.

\*HID-KBW

### 2.3.2 HID-KBW Serial Output at the Same Time

By scanning the following setup code,while HID KBW is output, data is output through serial port.

\*Forbid

Allow

### 2.3.3 HID-KBW Output Compatibility Mode

**\*Compatibility Mode 1**

**Compatibility Mode 2**

## **2.4 USB HID-POS**

### **2.4.1 HID-POS Device Mode**

If the device is an HID device (if it is not an HID device, pls read the configuration code of the HID device first),you can read the following configuration code and select HID-KBW device mode.

**HID-POS**

### **2.4.2 HID-POS HID-KBW Output at the Same Time**

By scanning the following setup code to enable HIDKBW data output while HIDPOS output.

**\*Forbid**

**Allow**

## **2.5 USB Virtual Serial Port**

Scan the following code to become virtual serial port output pattern when module connects PC by USB.

**USB Virtual serial port**

### 3 Read Mode

#### 3.1 Continuous Mode

On this mode, reading module read code continuous and automatic.

Break after reading one code, break time is changeable.

Click the toggle key to pause. Then click to continuous cyclic read code.

Default Continuous Mode

##### Time settlement for single read

The longest time before first successful reading. After this time, module will be into no read time.

Single Read time: 0.1~25.5 s, step-size: 0.1s;

0 means infinite time interval.

Default time: 5s

1000ms

\*5000ms

3000ms

infinite time interval

##### Break time settlement

Time between two read. Can be settled from 0 to 25.5 s, step-size: 0.1s; default 1.0s

No break

500ms

default 1000ms

1500ms

2000ms

**Same barcode reading delay**

The same barcode reading delay refers to that after the module reads the same bar code, it will be compared with the last reading time,when the interval is longer than the reading delay, the same barcode is allowed to be read, otherwise the output is not allowed.

\*Same barcode reading delay

Same bar code reading without delay

**Same barcode reading delay time**

When the same barcode reading delay is enabled,scan the following code to set same barcode reading delay time.

Infinite delay

500ms

\*1000ms

3000ms

5000m

**3.2 Induction Mode**

After setting, module begins to monitor brightness immediately. When scene changed, module will begin to read until time of image stabilization over.

After first successful reading or single reading time out, module will monitor brightness again after some time (changeable)

Module will cycle working as above when follow happen: module can't find code between single read time, then it will stop reading and jump to monitor brightness.

On induction mode, module can begin reading code by click, and it will begin to monitor brightness when release toggle key or successfully output information.

**Induction Mode**

**Time settlement for single read**

The longest time read before first successful reading. After this time, module will be into no read time.

Single Read time: 0.1~25.5 s, step-size: 0.1s;

0 means infinite time interval.

Default time: 5s

**1000ms**

**3000ms**

**Default 5000ms**

**infinite time interval**

**Break time settlement**

After one successful output or time out for single read. Module will be into monitor after some time.

Time from 0 to 25.5 s, step-size: 0.1s; default 1.0s

**No Break**

**500ms**

**Default 1000ms**

**1500ms**

**2000ms**

**Image stabilization time**

Image stabilization time: the time cost after module find scene change then waiting for the scene stable. Time from 0s to 25.5s, step size 0.1s. Default 0s.

\*0ms

100ms

400ms

1000ms

2000ms

**Sensitivity**

Detect the degree of change in the scene in inductive reading mode. When the reading module judges that the scene change degree meets the requirements, it will switch from the monitoring state to the reading state.

Ordinary sensitivity

Low sensitivity

\*High sensitivity

Extra high sensitivity

**Same barcode reading delay/Same barcode reading delay time**

The setup code is the same as in **Continuous Mode**.

**3.3 Manual Mode**

Manual mode is default mode. Click toggle key begin to read, stop when output or release toggle key

Manual Mode

Scan the following code to configuration edge trigger or level trigger.

\*Level Trigger

Edge Trigger

### 3.4 Command Triggered Mode

Module begins to read when receive scan command from mainframe( bit0 of zone bit 0x0002 writes"1" ) , and stop at output or read timeout.

Command triggered mode

Under command triggered mode, command for serial port trigger is 7E 00 08 01 00 02 01 AB CD;

After receiving command, model will output " 02 00 00 01 00 33 31" and start scan.

#### Time settlement for single read

Read and Scan time before output. From 0.1s to 25.5s, step size 0.1s. 0 : infinite time interval;  
Default: 5s

1000ms

3000ms

Default 5000ms

infinite time interval

### 3.5 POS Mode

Users can quickly configure the module to work in POS mode by scanning the following code. Including the following main features:

- Read mode is command trigger mode
- The communication interface is serial port
- Turn off startup tone
- Turn off ending character

POS Mode

## 4 Read area

### 4.1 Full Width Area

When the read area is a full-width area, the module will scan the barcode around with the center as the priority, and the barcode can be located at any position of the screen.

\*Full Width Area

### 4.2 Central Area only

When the reading area is the central area, the central position of the barcode must be in the central area set. Bar codes are not within the scope of the region are not identified and output.

Central Area only

Set the size of the central area:

The central area is an area with the center of the whole image as the central point. The size of this area is set in proportion to the width or height of the whole image, and the value range is 1-100. If set to 20, it is located in an area 20% of the width \* 20% of the height of the center.

### Modify the central area size

The common central area size can be set by scanning the following code:

central area size-20%

central area size-40%

central area size-60%

When the common central area size does not meet the needs, users can also scan the "modify the central area size" setting code to customize the configuration.

modify the central area size

Example: change the center area size to 50%

1. Check the character table to get the hexadecimal value of "50" characters: "32"
2. Confirm whether the setting code is on or not. If it is off, please scan the "open setting code" setting code (see section 1.7).
3. Scan the setting code of "modify the size of central area"
4. Scan data setting codes "3" and "2" successively (see appendix F)
5. Scan "save" setting code (see appendix G)

## 5 Lighting and Collimate

### 5.1 Lighting

Head lamp is used to additional lighting when read.

Normal(default): Head lamp will be on when read, others off.

Normally on: always on after boot.

OFF: head lamp is always off

**\*Normal**

**Normally on**

**Off**

### 5.2 External Lighting

**\*External Lighting Mode OFF**

**External Lighting Mode OFF**

**\*External Lighting High Level ON**

**External Lighting Low Level ON**

### 5.3 Collimation

There will be a pointing light beam which can help user to find best distance.

Normal(default): pointing light beam shows when read

Normally on: pointing light beam shows after power on until power off

No Collimation: no pointing light beam

**Normal(default)**

**Normally on**

**No Collimation**

## 6 Prompts

### 6.1 Sound Prompts

#### 6.1.1 Passive Buzzer

Read "buzzer drive frequency", the buzzer can be set to active/passive buzzer, the drive frequency of the passive buzzer can also be set.

**Buzzer drive frequency-passive high frequency**

**\*Buzzer drive frequency-passive medium frequency**

**Buzzer drive frequency-passive low frequency**

#### 6.1.2 Active Buzzer

**Buzzer drive frequency - active drive**

In the active buzzer mode, scan "Buzzer working level - high" can be set to low level when free, high level when busy; scan "Buzzer working level - low" can be set to high level when free, low level when busy.

**\*Buzzer working level - high**

**Buzzer working level - low**

## 6.2 All Prompts Tone

Silence: Close all prompt tones

Silence on

\*Silence off

## 6.3 Open Start-up Tone

Scan “Open Start-up tone” can open start-up tone. Scan “Close Start-up tone” can close start-up tone.

\*Open Start-up tone

Close Start-up tone

## 6.4 Read Code Prompts Tone

Read code prompt tone includes set the prompt tone and the read code successfully prompt tone:

\*Allow

Forbid

### 6.4.1 Successfully Prompts Tone Setting

In the state of "Allow Prompt Tone", you can scan the configuration code to enable or disable the setting success tone and reading success tone.

\*Open the setting success prompt tone

Close the setting success prompt tone

### 6.4.2 Read Successfully Prompts Tone

\*Open the reading success prompt tone

Close the reading success prompt tone

### 6.4.3 Duration Time Setting

Duration time setting. Default: 60ms

30ms

\*60ms

90ms

120ms

## 6.5 Startup LED Prompt

### 6.5.1 Startup Prompt LED Setting

After read “Allow Startup LED Prompt”,the DLED pin at the 12PIN outputs a high level pulse; Read “Forbid Startup LED Prompt”, cancel output a high level pulse at the DLED pin.

Allow Startup LED Prompt

\*Forbid Startup LED Prompt

### 6.5.2 Startup Prompt LED Duration Time

100ms

\*200ms

300ms

500ms

1000ms

2000ms

## 6.6 Read Successfully LED Prompt

### 6.6.1 Read Successfully LED Prompt Setting

After read “Allow Read Successfully LED Prompt”,the DLED pin at the 12PIN outputs a high level pulse; Read “ Forbid Read Successfully LED Prompt”, cancel output a high level pulse at the DLED pin.

\*Allow Read Successfully LED Prompt

Forbid Read Successfully LED Prompt

### 6.6.2 Read Successfully LED Prompt Duration Time

30ms

\*60ms

90ms

120ms

Russia

Canada (French)

Greece

Thailand

## 6.10 Virtual keyboard Allow

In order to be able to use in more areas, we also provide the virtual keyboard function, so that the virtual keyboard can be output in any keyboard mode, but it will relatively lose some output efficiency. In addition, when using a virtual keyboard, you must ensure that the numeric keys on the keypad are valid. Note that the virtual keyboard must be available at version 1.21 or above.

\*Standard keyboard

Virtual keyboard

In order to adapt to different application scenarios, the virtual keyboard has two different output modes for control characters smaller than 0x20, and the user can switch by scanning the following code.

Ctrl Mode

\*Alt Mode

## 7 Data Edition

Sometimes we need to edit the data before output to make data separation and processing more easily.

Data edition include:

- Add Prefix
- Output Identification Code AIM ID
- Output CodeID
- Add Suffix
- Cut data
- Add End words"Tail"

Output sequence after data edition:

【Prefix】 【AIM ID】 【CodeID】 【Data】 【Suffix】 【Tail】

### 7.1 Prefix

#### Add prefix

Prefix is on the head of encoding Information , and can be self-defined.

Scan the code to add prefix.

Allow to add prefix

Default no prefix

#### Change prefix

Scan "change prefix" and "setup code" code to change prefix.

Use 2 base 16 to express each character.

Max 15 characters.

ASCII on appendix E.

change prefix

**E.G. Change prefix to “DATA”**

1. "DTAT" in base 16: "44", "41", "54", "41"
2. Confirm open the " setup code", if not, find on 1.7
3. Scan "change prefix" code
4. Successively scan "Code ID": "4", "4", "4", "1", "5", "4", "4", "1"
5. Scan "save" code

**7.2 AIM ID**

AIM is Automatic Identification Manufacturers. AIM ID defines identification codes for various standard bar codes (users cannot customize AIM ID). For specific definitions, see Appendix C: AIM ID List. After decoding, the scanner can add this identification code to the bar code data, the format is "]" + letter" C "+ digit" 0 ". For example, the AIM ID of Code 128 is "]C0 ".

**Add AIM ID**

Users can identify different bar code types by AIM ID.

Users are not allowed to change the AIM ID which corresponding to each bar Code type. The Code ID is identified by three characters.

Allow Add AIM ID

\*Forbid Add AIM ID

**7.3 CODE ID**

**Add CODE ID**

Users can identify different types of bar code by CODE ID. CODE ID use one character to identify and can be self- defined.

**Allow add CODE ID**

**Default close CODE ID**

**Default of CODE ID**

Scan “ Default of CODE ID” to back default ID, default ID on appendix D

**\*all bar code back to default Code ID 0**

**all bar code back to default Code ID 1**

**all bar code back to default Code ID 2**

**Change CODE ID**

Users can change CODE ID of any bar code by scan the setup code (as follow) and data edition code.

Base 16 is used to express each CODE ID.

ASCII on appendix E.

**E.G.: change CODE ID of CODE 128 to “A”**

1. Find “A”=“41” in base 16
2. Confirm opening the “setup code”, if not, find on 1.7
3. Scan “ change CODE 128”
4. Successively scan “Code ID”: “4”, “1”
5. Scan “save” code

Change CODE ID LIST

Change CODE ID of EAN13

Change CODE ID of EAN8

Change CODE ID of UPCA

Change CODE ID of UPCE0

Change CODE ID of UPCE1

Change CODE ID of CODE 128

Change CODE ID of CODE 39

Change CODE ID of CODE 93

## 7.4 Cut out Data

Open to output part of data.

[Data] is composed of [Start] + [Center] + [End]

Character length of “start” and “end” can be changed

\*Output whole data

Output Start part

Output End Part

Output Center part

### Change length of [Start]-M

Scan “ Change M” code and “data edition” code to change length of [Start], max 255 characters

Base 16 is used to express length. ASCII on appendix E.

Change M

### Change length of [End]-N

Scan “ Change N” code and “data edition” code to change length of [Start], max 255 characters

Base 16 is used to express length. ASCII on appendix E.

Change N

**Output Start part**

**E.G. Output “1234567890123” of whole decode information “ 1234567890123ABC”**

1. “13” =”0D” in base 16
2. Confirm opening the “setup code”, if not, find on 1.7
3. Scan” change length M”
4. Successively scan “Code ID”: “0”, “D”
5. Scan “save” code
6. Scan” Output Start part”

**Output End Part**

**E.G. Output “ABC” of whole decode information “ 1234567890123ABC”**

1. “3” = “03” in base 16
2. Confirm opening the “setup code” , if not, find on 1.7
3. Scan ”change length N”
4. Successively scan “Code ID”:.”0”, “3”
5. Scan “save” code
6. Scan” Output Start part”

**Output Center part**

**E.G.: Output “0123” of whole decode information “ 1234567890123ABC”**

1. “ 10” =”0A”; “3”=”03” in base16
2. Confirm opening the “setup code” , if not, find on 1.7
3. Scan “change length N”
4. Successively scan “Code ID”:.”0”, “3”
5. Scan “save” code
6. Scan ” change length M”
7. Successively scan :Code ID”: “0”, “A”
8. Scan “save” code
9. Scan “Output Center part”

## 7.5 Suffix

### Add Suffix

Suffix on the end of encoding Information, and can be self-defined.

**Allow add suffix**

**Default no suffix**

### Change suffix

Scan “ change suffix” and “setup code” code to change prefix.

Use base 16 to express each character.

Max 15 characters. ASCII on appendix E.

**Change Suffix**

### E.G.: Change suffix to “DATA”

1. “DTAT” in base 16: “44”, “41”, “54”, “41”
2. Confirm opening the “setup code”, if not, find on 1.7
3. Scan “change suffix” code
4. Successively scan “Code ID”: “4”, “4”, “4”, “1”, “5”, “4”, “4”, “1”
5. Scan “save” code

## 7.6 Tail

Open this function to help system quickly distinguish current decoding results.

Scan “Add tail” to open this function, if read success, there will be tail on the end of decode data.

**Close tail**

**\*Change tail to “CR”**

Change tail to “TAB”

Change tail to “CRLF”

Change tail to two “CRLF”

Change tail to “CRDownArrow”

## 7.7 RF Information

RF(Read Fail): Users can self- define output information when read fail.

Output RF information

Default not output

### Change RF information

Scan “change RF information” and “data edition code” to change RF information.

Base 16 is used to express, max at 15 character. ASCII on appendix E.

Change RF information

#### E.G.: change RF to “FAIL”

1. Find “FAIL” in base-16: “46”, “41”, “49”, “4C”
2. Confirm opening the “setup code”, if not, find on 1.7
3. Scan “ change RF information”
4. Successively scan “4” 、 “6” 、 “4” 、 “1” 、 “4” 、 “9” 、 “4” 、 “C”
5. Scan “save” code

## 7.8 Output Protocol

The output format of the decoded result can be modified in serial/virtual serial mode by scanning the following Settings code.

The format output with protocol is as follows: <03>< length >< decoded data >.

Note: The protocol mode must use UTF-8 data output format. In other output formats, only output the pure data even if the output with the protocol is selected.

**\*Pure data**

**With the agreement**

## 8 Bar code type enables/disable configuration

### 8.1 All types of bar code can be decoded

After scan “ Forbid read all bar code” , module will only support to scan setup code.

Support all

Forbid read all bar code

\*Open default support types

### 8.2 Strengthen the Reading Ability

The bar code reading ability is enhanced through configuration, which will improve the reading Angle of all bar codes, improve the equipment's support for angles above 45° , and improve the contrast and gradient code support. Disabling Angle hardening will increase decoding speed.

\*Forbid to enhanced

Enhanced

### 8.3 EAN13

#### 8.3.1 EAN13

\*Allow reading EAN13

Forbid reading EAN13

### 8.3.2 EAN13 Transfer Check Character

EAN-13 bar code data is fixed at 13 bytes, and the last byte is the check character. Enable or disable the function of EAN-13 to transmit check characters by scanning the following setting codes.

**\*Allow**

**Forbid**

### 8.3.3 EAN13 Extra-code

**\* 2 bits extra-code Forbidden**

**2 bits extra-code Allow**

**\*5 bits extra-code Forbidden**

**5 bits extra-code Allow**

### 8.3.4 EAN13 Output Mode

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

**\*No need to read Extra-code, output directly**

**Have to read extra-code then have output**

## 8.4 ISSN

### 8.4.1 ISSN

**Allow reading ISSN**

**\*Forbid reading ISSN**

### 8.4.2 ISSN Extra-code

**\* 2 bits extra-code Forbidden**

**2 bits extra-code Allow**

### 8.4.3 ISSN Output Mode

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

**\*No need to read Extra-code, output directly**

**Have to read extra-code then have output**

## 8.5 ISBN

### 8.5.1 ISBN

Allow reading ISBN

\*Forbid reading ISBN

### 8.5.2 ISBN Extra-code

\*5 bits extra-code Forbidden

5 bits extra-code Allow

### 8.5.3 ISBN Output Mode

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

\*No need to read Extra-code, output directly

Have to read extra-code then have output

## 8.6 EAN8

### 8.6.1 EAN8

\*Allow reading EAN8

Forbid reading EAN8

### 8.6.2 EAN8 Transfer Check Character

EAN8 bar code data is fixed at 8 bytes, and the last byte is the check character. Enable or disable the function of EAN8 to transmit check characters by scanning the following setting codes.

**\*Allow**

**Forbid**

### 8.6.3 EAN8 Extra-code

**\* 2 bits extra-code Forbidden**

**2 bits extra-code Allow**

**\*5 bits extra-code Forbidden**

**5 bits extra-code Allow**

### 8.6.4 EAN8 Output Mode

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

**\*No need to read Extra-code, output directly**

**Have to read extra-code then have output**

### 8.6.5 EAN-8 to EAN-13

Allow

\*Forbid

## 8.7 UPCA

### 8.7.1 UPCA

\*Allow reading UPCA

Forbid reading UPCA

### 8.7.2 UPCA Transfer Check Character

UPCA bar code data is fixed at 13 bytes, and the last byte is the check character. Enable or disable the function of UPCA to transmit check characters by scanning the following setting codes.

\*Allow

Forbid

### 8.7.3 UPCA Extra-code

\* 2 bits extra-code Forbidden

2 bits extra-code Allow

**\*5 bits extra-code Forbidden**

**5 bits extra-code Allow**

### 8.7.4 UPCA Output Mode

**\*No Extra-code**

**Only read the code which have extra-code**

**All read**

### 8.7.5 UPC-A to EAN-13

**Allow**

**\*Forbid**

## 8.8 UPC-E

### 8.8.1 UPC-E0

**\*Allow reading UPCE0**

**Forbid reading UPCE0**

### 8.8.2 UPC-E1

**\*Allow reading UPCE1**

**Forbid reading UPCE1**

### 8.8.3 UPC-E Transfer Check Character(E0 and E1 take effect at the same time)

UPC-E bar code data is fixed at 8 bytes, and the last byte is the check character. Enable or disable the function of UPC-E to transmit check characters by scanning the following setting codes.

**\*Allow**

**Forbid**

### 8.8.4 UPC-E Extra-code(E0 and E1 take effect at the same time)

**\* 2 bits extra-code Forbidden**

**2 bits extra-code Allow**

**\*5 bits extra-code Forbidden**

**5 bits extra-code Allow**

Read the following setup code, which can be configured to output only if the extra-code is read, or to output without the extra-code is read.

**\*No need to read Extra-code, output directly**

**Have to read extra-code then have output**

### 8.8.5 UPC-E to UPC-A

Allow

\*Forbid

## 8.9 Code128

### 8.9.1 Code128

\*Allow reading Code128

Forbid reading Code128

### 8.9.2 Code128 Min Length of Reading

Scan following code to change min length of code 128

Code128 min length at 0

\*Code128min length at 4

## 8.10 Code39

### 8.10.1 Code39

\*Allow reading Code39

Forbid reading Code39

### 8.10.2 Code39 Min Length of Reading

Scan following code to change min length of code39

Code39 min length at 0

\*Code39 min length at 4

### 8.10.3 Code39 Check Setting(Modulo 43)

Code 39 does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transfer the last 1 bit together. If the verification fails, the barcode content will not be sent.

**\*Forbid Check**

**Allow Check,no transfer check character**

**Allow Check,transfer check character**

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 1 byte check character, the read will be fails.

For example, the minimum read length of Code 39 is 4 bytes, and no transfer check characters, the attempt to read Code 39 with a total length of 4 bytes will fail.

### 8.10.4 Code39 Start/End Character Settings

Scan following code to change start character and end character output of code 39

**\*Start character No Output**

**Start character Output**

**\*End character No Output**

**End character Output**

### 8.10.5 Code39 Full ASCII

**\*Forbid FullAsc Mode**

**Allow FullAsc Mode**

### 8.10.6 Code39 Pharmaceutical (PARAF)

Code 32 Pharmaceutical is a form of Code 39 used in Italian pharmacies.

The bar code is also known as PARAF. The output format of Code 32 is: \* + A + 8-bit digits + 1-bit check + \*.

Code 32 Pharmaceutical can only be read if Code39 is enabled and no checksum.

**\*Forbid Code 32**

**Allow Code 32**

## 8.11 Code93

### 8.11.1 Code93

**\*Allow reading Code93**

**Forbid reading Code93**

### 8.11.2 Code93 Min Length of Reading

Scan following code to change min length of code93

**Code93 min length at 0**

**\*Code93 min length at 4**

### 8.11.3 Code93 Check Setting

Code 93 does not enforce the inclusion of a check character; if there is a check character, it must be the last 2 bytes of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 2 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last 2 digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 2 bits of the barcode data. If the verification passes, the check character will be transfer the last 2 bits together. If the verification fails, the barcode content will not be sent.

**Forbid Check**

**\*Allow Check,no transfer check character**

**Allow Check,transfer check character**

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 2 bytes check character, the read will be fails.

For example, the minimum read length of Code 93 is 4 bytes, and no transfer check characters, the attempt to read Code 93 with a total length of 4 bytes will fail.

## 8.12 CodeBar

### 8.12.1 CodeBar

**\*Allow reading CodeBar**

**Forbid reading CodeBar**

### 8.12.2 CodeBar Min Length of Reading

Scan following code to change min length of CodeBar

**CodeBar min length at 0**

**\*CodeBar min length at 4**

### 8.12.3 CodeBar Check Setting(Mod-16)

Codebar does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transfer the last 1 bit together. If the verification fails, the barcode content will not be sent.

**\*Forbid Check**

**Allow Check,no transfer check character**

**Allow Check,transfer check character**

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 1 byte check character, the read will be fails.

For example, the minimum read length of Codebar is 4 bytes, and no transfer check characters, the attempt to read Codebar with a total length of 4 bytes will fail.

### 8.12.4 CodeBar Start/End Character Settings

There is a byte before and after the data as the start and end character,the start and end characters are one of the four characters "A", "B", "C", and "D",

You can set whether the start and end characters are transmitted together with the bar code data after read successful.

Scan following code to change start character and end character output of codebar.

**Send CodeBar Start Character**

**\*Don't send CodeBar Start Character**

## 8.13 Interleaved 2 of 5

### 8.13.1 Interleaved 2 of 5

**Allow**

**\*Frobid**

### 8.13.2 Interleaved 2 of 5 Min Length of Reading

**Interleaved 2 of 5 min length at 0**

**\*Interleaved 2 of 5 min length at 4**

### 8.13.3 Interleaved 2 of 5 Check Setting(Mod-10)

Interleaved 2 of 5 does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transfer the last 1 bit together. If the verification fails, the barcode content will not be sent.

Interleaved 2 of 5 code bits must be even and the check character is included in the code. If the code is odd, 0 will be added before the first bit. Check characters are automatically generated during code generation.

**\*Forbid Check**

**Allow Check,no transfer check character**

**Allow Check,transfer check character**

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 1 byte check character, the read will be fails.

For example, the minimum read length of Interleaved 2 of 5 is 4 bytes, and no transfer check characters, the attempt to read Interleaved 2 of 5 with a total length of 4 bytes will fail.

## 8.14 ITF-14

ITF-14 is a specific format of Interleaved 2 of 5 bar code. The total length of its data is 14 bytes. The last byte is the check character.

### 8.14.1 ITF-14

Allow

\*Forbid

## 8.15 ITF-6

ITF-6 is similar to ITF-14. The fixed total length is 6 bytes.

### 8.15.1 ITF-6

Allow

\*Forbid

## 8.16 Industrial 2 of 5

### 8.16.1 Industrial 2 of 5

Allow

\*Forbid

### 8.16.2 Industrial 2 of 5 Min Length of Reading

Industrial 2 of 5 min length at 0

\*Industrial 2 of 5 min length at 4

### 8.16.3 Industrial 2 of 5 Check Setting(Mod-10)

Industrial 2 of 5 does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check,no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transfer the last 1 bit together. If the verification fails, the barcode content will not be sent.

\*Forbid Check

**Allow Check, no transfer check character**

**Allow Check, transfer check character**

When set to “Allow Check, no transfer check character”, if the data length is less than the minimum read length after deducting the 1 byte check character, the read will fail.

For example, the minimum read length of Industrial 2 of 5 is 4 bytes, and no transfer check characters, the attempt to read Industrial 2 of 5 with a total length of 4 bytes will fail.

## 8.17 Matrix 2 of 5

### 8.17.1 Matrix 2 of 5

**Allow**

**\*Forbid**

### 8.17.2 Matrix 2 of 5 Min Length of Reading

**Matrix 2 of 5 min length at 0**

**\*Matrix 2 of 5 min length at 4**

### 8.17.3 Matrix 2 of 5 Check Setting (Mod-10)

Matrix 2 of 5 does not enforce the inclusion of a check character; if there is a check character, it must be the last byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

“Allow Check, no transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, it will be transmitted the normal data except the last

digit of the check character. If the verification fails, the barcode content will not be sent.

“Allow Check,transfer check character”: the scanner will perform verification according to the last 1 bit of the barcode data. If the verification passes, the check character will be transfer the last 1 bit together. If the verification fails, the barcode content will not be sent.

**\*Forbid Check**

**Allow Check,no transfer check character**

**Allow Check,transfer check character**

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 1 byte check character, the read will be fails.

For example, the minimum read length of Matrix 2 of 5 is 4 bytes, and no transfer check characters, the attempt to read Matrix 2 of 5 with a total length of 4 bytes will fail.

## 8.18 Code 11

### 8.18.1 Code 11

**Allow**

**\*Forbid**

### 8.18.2 Code 11 Min Length of Reading

Code 11 min length at 0

\*Code 11 min length at 4

### 8.18.3 Code 11 Check Setting

Code 11 does not enforce the inclusion of a check character; if there have check character, it must be the last byte of the data or last 2 byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

\*Forbid Check

Allow Check,no transfer check character

Allow Check,transfer check character

## 8.19 MSI-Plessey

### 8.19.1 MSI-Plessey

Allow

\*Forbid

### 8.19.2 MSI-Plessey Min Length of Reading

**\*MSI-Plessey min length at 0**

**MSI-Plessey min length at 4**

### 8.19.3 MSI-Plessey Check Setting

MSI-Plessey does not enforce the inclusion of a check character; if there have check character, it must be the last byte of the data or last 2 byte of the data. The check character is the calculated value of all data except the check character, which is used to check whether the data is correct.

“Forbid Check”: the scanner will transfer all data

**\*Forbid Check**

**MSI 1 bit check**

**MSI 2 bit check**

### 8.19.4 MSI-Plessey Transfer check character

**\*MSI Transfer Check Character**

**MSI NO Transfer Check Character**

When set to “Allow Check,no transfer check character”,if the data length is less than the minimum read length after deducting the 2 bytes check character, the read will be fails.

### 8.23.2 DM Double Code Read

Data Matrix double code: two Data Matrix bar codes arranged up and down or left and right. The direction of the double code should be consistent, the difference should be as small as possible, and the distance should be as close as possible. The two code setting is divided into the following three settings.

Only read single Data Matrix: The device only read one Data Matrix bar code at any time

Only read double Data Matrix: At any time, the device must detect the Data Matrix double code and send the decoding information only after both codes are decoded successfully. The sending sequence is from top to bottom or left to right.

Can read single and double DM codes: Readable single and double Data Matrix codes: check whether the Data Matrix double codes exist first when reading codes. If the Data Matrix double codes exist and are decoded successfully, the Data Matrix double codes will be sent; otherwise, the Data Matrix double codes will be processed as single codes.

**\*Only read single Data Matrix**

**Can read single and double DM codes**

## 10 Serial Port Instruction

Users can settle the module by sending instruction from mainframe.

Please make sure communicate parameter complete matching between module and mainframe.

Module default serial communicate parameter: **Baud rate 9600bps; No check; 8 bit data; 1 bit stop bit; No flow control.**

### 10.1 CRC Algorithm

CRC: CRC\_CCITT check value (2 bytes).

Suitable for Types、Lens、Address、Datas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

Reference code of C:

```

unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //上一位 CRC 乘 2 后, 若首位是 1, 则除以 0x11021
                crc ^= 0x11021;
            if((*ptr&i) != 0) //如果本位是 1, 那么 CRC = 上一位的 CRC + 本位/CRC_CCITT
                crc ^= 0x1021;
        } // for(unsigned char i = 0x80; i != 0; i /= 2)
        ptr++;
    } // while(len-- != 0)
    return crc;
} // unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)

```

PS: when no need for checking CRC, CRC bite can be filled in 0xAB 0xCD

## 10.2 Read Zone Bit

Max 256 bytes/time for zone bit reading.

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x07 (1 byte)

Lens: 0x01 (1 byte)

Address : 0x0000~0x00FF (2 bytes) , address to start reading zone bit

Datas: 0x00~0xFF (1 byte) , Numbers of zone bit for Sequential read, 0x00= 256bytes

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、Address、Ddatas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

The reference code of C is as follows:

```

unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //Last CRC * 2 , if the first one is 1, so divide 0x11021
                crc ^= 0x11021;
            if(*ptr&i != 0) //If the standard is 1, so CRC = last CRC + standard CRC_CCITT
                crc ^= 0x1021;
        } // for(unsigned char i = 0x80; i != 0; i /= 2)
        ptr++;
    } // while(len-- != 0)
    return crc;
} // unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)

```

Note: users can fill 0xAB 0xCD at CRC byte when CRC validation is not required.

**Output: {Head2} {Types} {Lens} {Ddatas} {CRC}**

1) Read successfully and return data

PS: Head2: 0x02 0x00 (2 bytes)

Types: 0x00 (read succeed) (1 byte)

Lens: numbers of upload bytes (1 byte) 0x00 means 256

Datas: 0x00~0xFF means read data.

CRC: CRC\_CCITT check value (2 bytes) . Suitable for Types、Lens、Datas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

(The reference code is the same as above)

2) CRC failed

No response command

3) Unknown command response

No response command

**E.G.:**

Read address 0x000A of Zone bit

1) Read successfully and return data is 0x3E.

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01 0xEE 0x8A

Output: 0x02 0x00 0x00 0x01 0x3E 0xE4 0xAC

2) CRC wrong

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01 0x11 0x22

Output : None

3) When length of command to short or more than 400ms after 0x7e 0x00, treat as unknown command.

Input: 0x7E 0x00 0x07 0x01 0x00 0x0A 0x01

Output: None

## 10.3 Write Zone Bit

Max 256 bytes/time for zone bit reading.

**The modified content of the zone bit will be lost after power failure. If the modified content is needed after power loss, You need to save the zone bit to internal Flash(10.4).**

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x08 (1 byte)

Lens: 0x00~0xFF ( 1 byte ) , means numbers of bytes of this datas, times of continuous writing.

Address: 0x0000~0xFFFF ( 2 bytes ) , start location of write

Datas: 0x00~0xFF ( 1~256 bytes ) , dates wrote in zone bit. When configuring multiple zone bit,must follow the order of address from low to high to fill the data domains.

CRC: CRC\_CCITT check value (2 bytes). Suitable for Types、Lens、Address、Datas;

Characteristic polynomial :  $X^{16}+X^{12}+X^5+1$ , multinomial coefficient: 0x1021, original value:0 ;

For single byte, the highest bit will be calculated at first, output will be without negation.

The reference code of C is as follows:

```

unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)
{
    unsigned int crc = 0;
    while(len-- != 0)
    {
        for(unsigned char i = 0x80; i != 0; i /= 2)
        {
            crc *= 2;
            if((crc&0x10000) != 0) //Last CRC * 2 , if the first one is 1, so divide 0x11021
                crc ^= 0x11021;
            if(*ptr&i != 0) //If the standard is 1, so CRC = last CRC + standard CRC_CCITT
                crc ^= 0x11021;
        } // for(unsigned char i = 0x80; i != 0; i /= 2)
        ptr++;
    } // while(len-- != 0)
    return crc;
} // unsigned int crc_cal_by_bit(unsigned char* ptr, unsigned int len)

```

Note: users can fill 0xAB 0xCD at CRC byte when CRC validation is not required.

### Output: {Head2} {Types} {Lens} {Datas} {CRC}

#### 1) Read successfully

PS: Head2: 0x02 0x00 ( 2 bytes )

Types: 0x00 ( read succeed ) ( 1 byte )

Lens: 0x01 ( 1 byte )

Datas: 0x00 ( 1 byte )

CRC: CRC\_CCITT check value (0x33 0x31) ( 2 bytes )

#### 2) CRC failed

No response command

3) Unknown command response

No response command

**E.G.:**

Write 0x3E in 0x000A of zone bit

1) Successfully set

Input : 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E 0x4C 0xCF

Output: 0x02 0x00 0x00 0x01 0x00 0x33 0x31

2) CRC wrong

Input: 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E 0x11 0x22

Output: None

3) When length of command to short or more than 400ms after 0x7e 0x00, treat as unknown command.

Input: 0x7E 0x00 0x08 0x01 0x00 0x0A 0x3E

Output: None

## 10.4 Save Zone Bit To Internal Flash Instruction

To save the device of the zone bit list to internal Flash, you need to send a save command.

**Note:** the device cannot save a single zone bit configuration separately, and must keep the entire list at the same time.

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x09 (1 byte)

Lens: 0x01 (1 byte)

Address: 0x0000 (2 bytes)

Datas: 0x00 (1 byte)

CRC: CRC\_CCITT check value (0xDE 0xC8) (2 bytes)

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Saved successful

PS: Head2: 0x02 0x00 (2 bytes)

Types: 0x00 (read succeed) (1 byte)

Lens: 0x01 (1 byte)

Datas: 0x00 (1 byte)

CRC: CRC\_CCITT check value (0x33 0x31) (2 bytes)

2) CRC failed

No response command

3) Unknown command response

No response command

## 10.5 Zone Bit Reset To Defaults

Command Format:

**Input: {Head1} {Types} {Lens} {Address} {Datas} {CRC}**

PS: Head1: 0x7E 0x00 (2 bytes)

Types: 0x08 (1 byte)

Lens: 0x01 (1 byte)

Address: 0x00D9 (2 bytes)

Datas: 0x50 (1 byte)

CRC: CRC\_CCITT check value (81 D3) (2 bytes)

**Output: {Head2} {Types} {Lens} {Datas} {CRC}**

1) Saved successful

PS: Head2: 0x02 0x00 (2 bytes)

Types: 0x00 (read succeed) (1 byte)

Lens: 0x01 (1 byte)

Datas: 0x00 (1 byte)

CRC: CRC\_CCITT check value (0x33 0x31) (2 bytes)

2) CRC failed

No response command

3) Unknown command response

No response command

## 10.6 List of zone bit

Zone Bit	0x0000
Data Bit	Function
Bit 7	1: Open LED when successfully read 0: Close
Bit 6	1: Mute off 0: Mute on
Bit 5-4	00: No light 01: Standard 10/11: Always on
Bit 3-2	00: No light 01: Standard 10/11: Always on

## 11 Appendix A: Common serial port instruction

Parameter		Default Setting		Note
Communication interface				
TTL-232	Baud rate	9600		
	Verification	No		
	Bata Bit	8 bit		
	Stop Bit	1 bit		
	CTSRTS	No		
Mode Parameter				
Default Read Mode			Continuous Mode	
Serial mode	Read code time for once	5s	Parameter:0.1-25.5s; step-size: 0.1s; 0 means no time limited	

## 12 Appendix B: Common serial port instruction

Function	Instruction
Baud rate to 9600	7E 00 08 02 00 2A 39 01 A7 EA
Save settlements to Internal Flash	7E 00 09 01 00 00 00 DE C8
Find baud rate	7E 00 07 01 00 2A 02 D8 0F

Module will return following info after mainframe send serial port instruction - find baud rate

Return information	Baud rate
02 00 00 02 C4 09 SS SS	1200
02 00 00 02 71 02 SS SS	4800
02 00 00 02 39 01 SS SS	9600
02 00 00 02 D0 00 SS SS	14400
02 00 00 02 9C 00 SS SS	19200
02 00 00 02 4E 00 SS SS	38400
02 00 00 02 34 00 SS SS	57600

PS: SS SS= check value

## 13 Appendix C: AIM ID

Code Type	AIM ID	Instruction
Code 128	JC0	Code 128
EAN-8	JE4	EAN-8
EAN-13	JE0	EAN-13
ISSN	JX5	
ISBN	JX4	
UPC-E	JE0	UPC-E
UPC-A	JE0	UPC-A
Interleaved 2 of 5	JJ0	No parity
ITF-6	JJ0	Output check character
ITF-14	JJ0	Output check character
Matrix 2 of 5	JX1	No parity
Industrial 25	JS0	No specific designation now
Code 39	JA1	MOD 43 check, Output check character
Codabar	JF0	Standard data packet
Code 93	JG0	No specific designation now
Code11	JH1	MOD11/MOD11 double check, Output check character
MSI Plessey	JM1	MOD10 check, but no output check character
GS1 Databar (RSS)	Je0	RSS-14, RSS-Limited, RSS-Expanded, RSS-Stacked
PDF417	JL0	Conform to 1994 PDF417
Data Matrix	Jd1	DM code ECC 200
QR Code	JQ1	QR code mode 2( 2005 symbol), The ECI protocol is not used
Micro PDF417	JL0	
Micro QR	JQ1	
Aztec Code	Jzm	(0-9, A-C), Possible AIM ID qualifying parameter (m)

## 17 Appendix G: Save or Cancel

After reading the data code, you need to scan the "save" setting code to save the data which you read. If there is an error when reading the data code, you can cancel the error reading.

For example, read a set code, and read data "A", "B", "C" and "D" in turn.

If you read "cancel the last read bit", the last read digit "D" will be cancelled.

If you read "cancel the previous read a string of data" will cancel the read data "ABCD",

If you read "cancel modification Settings", you will cancel the data "ABCD" and exit the modification Settings.

Save

Cancel the last read bit

Cancel the previous read a string of data

Cancel modification settings
